

INFORMING POLICY AND PRACTICE THROUGH DATA AND COLLABORATION

What Is Health Trends Across Communities (HTAC)?

Health Trends Across Communities (HTAC) uses summary information from electronic health records (EHRs) to bridge gaps in the resources available to public health and healthcare professionals, policymakers, and community organizations to meaningfully improve the health of communities in Minnesota.

The information in HTAC is produced by the Minnesota Electronic Health Record (MN EHR) Consortium, a public-private collaboration of healthcare systems, public health departments, and other cross-sector partners. In 2025, HTAC information represented 94% of the state population. Data are updated annually and available through an interactive, publicly available dashboard and a public-use data file request.

HTAC reports:

- Trends in prevalence for over 70 high-priority health conditions and condition categories across Minnesota.
- Summary information by patient characteristics, including race, ethnicity, language, sex, age, homelessness, incarceration, and Medicaid status.
- Data at the state, county, zip code, and census tract levels.

Fulfilling the Need

HTAC has been used to improve community health needs assessments; develop place-based interventions; allow adult health surveys to focus on social drivers of health or simply be shorter; support grant applications; and provide regional agencies, county commissioners, and others with up-to-date population health information to inform policy decisions and resource allocation strategies.

HTAC complements traditional population health information. Recent data show that one in four Minnesotans had a mental health condition, with notable demographic and geographic disparities. By providing robust, real-time, cross-sector data such as these, HTAC helps assess community health needs and advance health equity.

"HTAC is truly a miracle, an amazing feat!"

- Local public health professional

"Being able to access data that is timely like this is a game changer for public health."

- Local public health professional

This work is funded through a Minnesota Public Health Infrastructure Grant from the Minnesota Department of Health.
